

LakeSmart

LakeSmart

is a free, voluntary education program to evaluate watershed properties with a goal to protect water quality. Property owners will get suggested improvements to their site for ways to reduce erosion and stormwater runoff which can carry pollutants and phosphorous into the water.

Phosphorous

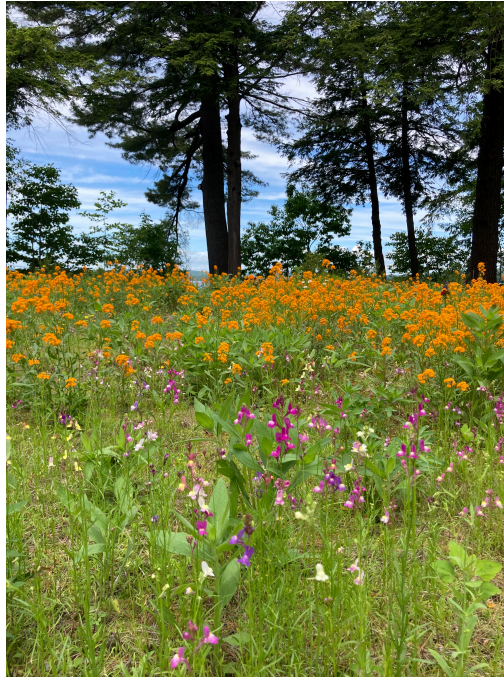

is found in fertilizer, pet waste, motor oil and household cleaners and soil. Too much phosphorous puts a lake out of balance and feeds **algal blooms**.

To learn how to build a healthy buffer for a clear lake.

A wildflower meadow can minimize grass which has an insufficient root structure to capture nutrients from stormwater runoff.

Let's live lightly on the land for the sake of the water and for those who depend on it!
